GKS 2.0 - POS Certification Procedure

1. Introduction

This document describes the certification procedure for producers wishing to have a POS system certified. It provides a concise overview of the steps, required documents and key considerations for preparing and submitting a complete certification application.

2. Procedure overview

Step 1 - Preparatory technical Q&A session (optional)

Producers who would like additional clarification before submitting their application may request a Q&A session through the secretariat at secr.gksce@minfin.fed.be.

During this virtual session, they can ask questions about preparing the certification application. The session lasts approximately one hour and is conducted by a member of the certification team.

Step 2 - Submission of the application

The application must be submitted using the application form, together with the required documentation and test results described in section 3. The documents must be sent to secr.gksce@minfin.fed.be.

An application is considered complete only when all required information has been provided.

Step 3 - Pre-intake (virtual)

After the file has been received, an online pre-intake meeting is organized. The producer can briefly present the system, and the certification team provides initial feedback on the submitted documents and test results. Changes may be required based on this feedback, after which the amended tests must be resubmitted.

If the file is not sufficiently advanced, a second pre-intake will be organized. Once all documents and test results are in order, and after explicit approval by the certifier, the producer may install no more than five test environments at customer sites to continue testing under real-world conditions.

Step 4 - Intake

During the intake, the cash register system is physically installed in the certification team's laboratory in Brussels. Electrical power and an open internet connection via Wi-Fi or UTP cable are provided. For a cloud-based cash register system, the producer is also asked to attend in person to present the system.

At this stage, the certification team uses the previously submitted test results to verify the correct operation of the system and its basic functions. Further feedback is then provided so that any blocking issues can be resolved before certification begins.

Step 5 - Certification

When the certifier begins testing, the producer is contacted. The system undergoes extensive testing to verify compliance with all requirements and the correct implementation of the JSON structures. Feedback reports may be issued to identify the changes required to make the system compliant.

Step 6 - Second-line testing

As an additional control, the cash register system is tested either by the head of service or by a certifier other than the person who handled the file. This independent second review confirms the earlier results before the certificate is issued.

Step 7 - Certificate

After successful completion of all steps, the certificate is prepared and published on the website.

After certification

Producers wishing to distribute their certified system themselves must register as a distributor.

The entire certification process, including the associated certificate, is free of charge.

3. Required documents

The documents referred to below are available on the official GKS/SCE website - GKS - Het Geregistreerd Kassasysteem under the GKS/SCE 2.0 certification section, including the POS Certification Manual: Certificatiehandleiding POS(ENG)

3.1 Test setup

Before testing begins, the producer must configure the fictitious test environment described in UC_TestSetup_20240806.pdf on its own POS system. This document is the reference for the complete test configuration: the fictitious hospitality establishment, zones and tables, associated POS and FDM devices, test employees, and the full list of test products with their identifiers, prices, rates and VAT labels. The price lists and rates must be reproduced exactly. All submitted test results must be generated using this test setup.

3.2 Test results (Report_Testing folder)

The producer must perform the tests applicable to the functions for which certification is requested. For example, if the POS system supports partial refunds and the producer wants this function to be certified, the corresponding partial-refund tests must be performed and submitted.

For each test, both the JSON request and the JSON response must be provided. When a receipt is printed, such as a VAT receipt or bar receipt, a photograph or PDF version of the receipt must also be submitted.

3.3 Submitting an application

The following information must be submitted with the certification application:

- The signed application form: 20250115_AANVRAAGFORMULIER_CERTIF_POS-FDM_NL or 20250115_FORMULAIRE DEMANDE_CERTIF_POS-FDM_FR

- The fully completed POS Certification Manual: 20250307_POS_CERTIFICATIE_HANDLEIDING_V1.1 or 20250307_FR - Manuel de certification_POS_V11
- An overview of potential distributors
- The manual or manuals intended for the distributor or end user
- A technical description of the production process for the equipment
- A detailed technical description of how all technical requirements have been incorporated
- A complete description of the data used and generated by the equipment
- All test results produced using the prescribed test setup

An application is valid only when all the items listed above have been submitted in full.

The documents and test results may be submitted as a ZIP file. Producers who prefer to use an upload platform can contact the certification team. A platform will then be made available for uploading the files.

4. Updates and new versions

The producer must provide the certification team with every new version or update of the certified system. Updates that affect the GKS/SCE component may be installed at customer sites only after they have been certified. Urgent bug fixes or solutions for blocking issues at customer sites are an exception to this rule, but they must still be reported to the certification team.
